

## CS241#20 — CSP II. Deadlock II and Dining Philosophers

1. Do we have a winner for the CRITICAL SECTION PROBLEM? Contestant #4:

Three shared variables: `turn = 1`, `flagA = FALSE`, `flagB = False`

<pre>thread1:   flagA = TRUE   if(flagB) while(turn==2){ /* check again */}   // Do Critical Section stuff   turn = 2   flagA = FALSE</pre>	<pre>thread2:   flagB = TRUE   if(flagA) while(turn==1){ /* check again */}   // Do Critical Section stuff   turn = 1   flagB = FALSE</pre>
---	---

## 2. Deadlock

The \_\_\_\_\_ conditions for deadlock are:

\_\_\_\_\_: "A process is currently holding at least one resource and requesting additional resources which are being held by other processes."

\_\_\_\_\_: "There is a set of waiting processes, such that  $P_1$  is waiting for a resource held by  $P_2$ ,  $P_2$  is waiting for a resource held by  $P_3$  and so on until  $P_N$  is waiting for a resource held by  $P_1$ ."

\_\_\_\_\_: "A resource can be released only voluntarily by the process holding it, after that process has completed its task"

\_\_\_\_\_: "At least one resource must be held in a non-shareable mode"

Three gardeners visit the garden shed pick up their desired tools for the day. There is a potential for deadlock. Fortunately they know about the C\_\_\_\_\_ conditions! Find four ways to solve the problem (break one condition each time). Name which condition you break in each case.

Remember Mergesort? How can you implement parallel Mergesort? Explain what synchronization calls you will use and when.

What is the Dining Philosophers problem?

Candidate Solutions:

1. "Pick up left chopstick. Pickup right chopstick. Eat. Release both."

2. "Pick up right. Pick up left. Eat. Release both"

3. "Eat when I tell you"

4. "Pick up left chopstick. Try to pickup right chopstick (Fail? release both and restart). Eat. Release both."
